Release Details

Release Title

Chargent version 6.72

Release Installation URL

[Chargent Installation & Updates](#)

Release Overview

Has your team wanted to integrate sending payment request emails from a different process, a different page, or component? This release gives your users the power to Send Payment Request notices from inside your LWCs, your custom Flows, and your code. Our new Send Payment Request Lightning Web Component expands the flexibility of the already-powerful Payment Request feature so that it fits more of your use cases.

This version also includes the following benefits to the Chargent application:

- Improved Lyons ACH Validation integration
- No fuss compatibility with the Salesforce Spring '23 Update

New Features

Send Payment Request Lightning Web Component (LWC)

Where: Chargent Base, Salesforce Flows, Lightning Pages

This standalone component can be embedded in a Salesforce Flow or Lightning Page in order to allow your users to quickly send a Payment Request when they need, from where they're already working. This feature removes the requirement to configure the Chargent Anywhere component in order to provide the same functionality.

The Send Payment Request LWC is intelligent and can be configured to pre-populate fields when needed, and can even create a Chargent Order record if one does not already exist. Our most popular feature just got better.

Enhancements

Salesforce Spring '23 Compatibility

Chargent 6.72 has been updated for full compatibility with Salesforce's Spring '23 update, including the newly enforced ICU Locale Formats changes. All core functions and interfaces of our app have been tested and - where needed - update to comply with Salesforce's latest version.

Fixes

Lyons ACH Validation Integration Issue - **Fixed**

Fixed an issue wherein ACH validations using our Lyons integration were not completing, sometimes resulting in transaction failures due to authenticating to test endpoints.

Known Issues & Problems

Lyons Remote Site Activation

When first enabled in the Gateway Setup Wizard, the remote sites for Lyons ACH Validation may not activate automatically.

Workaround

To activate the Lyons remote sites:

1. Click the gear icon at the top-right of Salesforce, then click **Setup**
2. In the Quick Find field at the top-left, search for "remote site," then click **Remote Site Settings**
3. Click **Edit** next to "Lyons_Prod"
4. Check the "Active" checkbox, then click the **Save** button
5. Repeat these steps for the "Lyons_Sandbox" if you wish to conduct Lyons ACH Validation tests
