Release Title

Chargent version 6.90

Release Installation URL

[Chargent Installation & Updates](#)

Release Overview

Chargent v6.90 delivers our newest payment gateway integration; Rectangle Health. This integration supports the most popular payment functions right in Salesforce, reducing payments friction and getting cash into your account faster. This integration also leverages tokenization in order to ensure payment security for your business and your customers.

New Features

New Payment Gateway Integration - Rectangle Health

Where: Chargent Base 6.90 and newer

We're excited to announce our new integration to the Rectangle Health payment gateway. This integration supports the most popular payment functions for Credit Card and ACH transactions in the US, including: Tokenize, Authorize, Charge / Capture, Void, and Refund.

Note: use of this payment gateway integration in Chargent requires the enablement of tokenization. Tokenizing card and bank account information ensures that sensitive data is not stored within the Salesforce environment. This extra layer of security protects your customers, and reduces the scope of PCI DSS requirements for your business.

Note: this integration does not yet support Strong Customer Authentication (SCA).

Enhancements

Improved Field Help Text on Payment Forms

Updated the help text icons on our payment forms for greater visibility and access.

Updated Help Text of Merchant Account ID Field in Gateway Setup Wizard

Updated this help text to better direct Braintree users in the use of this field during the setup of Braintree gateway records.

Updated Labels of Order Title and Order Descriptor Fields

Changed the 'Order Title' and 'Order Descriptor' field labels on the Chargent Orders object to 'Payment Title' and 'Payment Descriptor' in order to align with the API names of these fields.

Take Payment Component - Layout Update

Updated the layout of the Take Payment Component to ensure that all elements and buttons are accessible regardless of the page-location of the configured component.

Salesforce Spring '23 Compatibility

Chargent 6.90 has been updated for full compatibility with Salesforce's Summer '23 update. All core functions and interfaces of our app have been tested and - where needed - update to comply with Salesforce's latest version.

Take Payment Component - Nickname Field Position

Updated the Take Payment Component so that the 'Nickname' field is positioned for greater visibility / access on the payment form.

Fixes

Payment Request Templates with Apex

Fixed an issue wherein Payment Request records generated by APEX did not properly assign the default template when no template was explicitly chosen in the call.

Chargent Anywhere - Internal Server Error, Promise Rejected

Fixed an issue wherein the Chargent Anywhere component would cause intermittent internal server errors when used for ACH transactions on the Braintree gateway integration.

Chargent Custom Checkout - API FP Errors

Fixed an issue wherein a loading graphic is displayed indefinitely when collecting a payment in the Chargent Custom Checkout with API access is enabled.

Take Payment Component with SCA Enabled

Fixed an issue wherein the Take Payment Component would not complete a payment collection when Strong Customer Authentication was enabled using the Cybersource payment gateway.
